BIT ALLOCATION FOR DEPENDENT QUANTIZATION WITH APPLICATIONS TO MPEG VIDEO CODERS

ABSTRACT

We address the problem of efficient bit allocation in a dependent coding environment. While optimal bit allocation for independently coded signal blocks has been studied in the literature, we extend these techniques to the more general dependent coding scenarios. Of particular interest is the topical MPEG [1] video coder. We show how a certain monotonicity property of dependent operational rate-distortion curves, verified through MPEG simulations, can be exploited in formulating fast ways to obtain optimal and near-optimal solutions (in the R-D sense) for the MPEG bit allocation problem.

est is the topical MPEG [1] video coder. We show how a certain monotonicity property of dependent operational rate-distortion curves, verified through MPEG simulations, can be exploited in formulating fast ways to obtain optimal and near-optimal solutions (in the R-D sense) for the MPEG bit allocation problem.

million cellphones and another mountain of old PDAs, MP3 players, and game consoles. We could, of course, build bigger landfills to accommodate the billions of obsolete gizmos we throw away each year. But here's a much better idea: building a wireless multimedia device whose hardware and software can be easily altered or upgraded so it never becomes obsolete. When a new communications standard or multimedia format comes along, the device could be made to conform to it simply by downloading circuit and software modifications.

Let's say your Wi-Fi-enabled device supports IEEE 802.11b but not IEEE 802.11g? No problem. Just download the new standard and have your device reconfigure itself. Fixing bugs and installing security patches to guard against the virus du jour would be just as easy.

That's the vision we're working toward at Intel University.
